

GIA for SHOPLINE

Technical Compliance One-Pager

GIA should be submitted as one unified SHOPLINE Public app, not two separate apps. The app has two functions: AI Blog publishing and Fashion Intelligence product ranking. Studio GIA Fashion runs the central trend pipeline, Supabase stores the intelligence/content data, and the SHOPLINE app consumes that prepared data through controlled APIs.

Decision point	Position
SHOPLINE category	Public app: intended for App Store distribution, multi-merchant installation, OAuth 2.0, and SHOPLINE review.
Core principle	No SHOPLINE-side scraper and no per-merchant trend scraping. Merchant store data is read through SHOPLINE APIs only.
Central data layer	Studio GIA Fashion creates fashion intelligence; Supabase stores trend records, approved AI Blog content, scoring inputs, templates

Two Functions Inside One App

Function	How it works
AI Blog	Merchants choose ready GIA articles/editorial assets sourced from Studio GIA Fashion/Supabase. If native publishing is enabled, the a
Fashion Intelligence	The app reads the merchant catalog through SHOPLINE product APIs, compares products against GIA's already-scraped Supabase tr

Merchant Workflow

- Install GIA Public app and grant required catalog/content permissions.
- Use AI Blog to select ready GIA articles or editorial assets.
- Use Fashion Intelligence to rank catalog products against GIA trend data.
- Generate limited dashboards, banners, collages, email, or social assets from selected products.
- Publish to SHOPLINE where enabled, or download assets for email, social media, and campaigns.

SHOPLINE Compliance Posture

- Request least-privilege scopes: read_products, read_content/write_content if native blog publishing is enabled, bulk operations only if needed, and required webhooks.
- Avoid customer, order, and payment scopes in the first release unless a future feature explicitly requires them.
- Store OAuth tokens server-side only; never expose tokens or API keys in storefront JavaScript.
- Implement uninstall and GDPR/compliance webhook handling.
- Privacy/review notes must say GIA trend data and AI Blog content are centrally prepared by Studio GIA Fashion and stored in Supabase, not scraped separately for each merchant.

Target Users

Primary users are fashion merchants with large catalogs: boutiques, dropshipping stores, marketplace-driven fashion businesses, and online fashion brands. Secondary users include digital creators and digital product sellers who want ready fashion-led editorial content or visual campaign assets to enrich their SHOPLINE storefront.

Implementation dependency: confirm the target SHOPLINE API version supports the exact create/update workflow for blog articles. SHOPLINE docs already show content scopes, blog collections, and blog post query/update/delete APIs.
